

Creating New Tables

UPDATE – CREATING A NEW TABLE

```
import pyodbc
connectionString = r'DRIVER={ODBC Driver 13 for SQL  
Server};SERVER=.\SQLEXPRESS;DATABASE=northwind;Truste  
d_Connection=yes'
```

```
sqlStr="""CREATE TABLE Student (  
    StudentID int NOT NULL,  
    FirstName nvarchar(40) NOT NULL,  
    Surname   nvarchar(30) NULL,  
    Course   nvarchar(30) NULL,  
    City nvarchar(15) NULL)"""  
conn = pyodbc.connect(connectionString)  
cur = conn.cursor()  
cur.execute(sqlStr)
```

```
conn.commit()  
conn.close()
```

CHECK IF THE TABLE EXISTS

```
sqlStr=""  
IF EXISTS(  
    SELECT TABLE_NAME, TABLE_SCHEMA  
    FROM INFORMATION_SCHEMA.TABLES  
    WHERE TABLE_NAME = 'Student'  
    AND TABLE_SCHEMA = 'dbo')  
BEGIN  
    DROP TABLE Student  
END""
```

1. Check if the table exists.
2. Write the code for creating the student table (see the previous slide).

Any questions?

A large, solid teal arrow pointing to the right, spanning the width of the slide and partially overlapping the dark blue background.

Thank you!

Hope you enjoyed this learning journey!
